**Title: Using fractional quantum Hall states
to enhance polariton-polariton interactions**

Dr. Sylvain Ravets

Centre national de la recherche scientifique, Centre de Nanosciences et de
Nanotechnologies (C2N), France

Abstract: We show experiments on a two-dimensional electron system (2DES) embedded in an optical cavity, where coupling of photons to Fermi polarons leads, in the strong coupling regime, to the formation of polaron polaritons [1,2]. Under an external magnetic field, the cavity polaron coupling depends on the 2DES filling factor, leading to nonlinear energy shifts of the polariton lines around quantum Hall states [2,3]. We investigate potential applications of these energy shifts for nonlinear quantum optics. We measure the time-resolved nonlinear response of the system, and demonstrate enhanced polariton-polariton interactions around fractional quantum Hall states. At filling factor $2/5$, interactions are increased by more than an order of magnitude.
